Description:

Cloud testing is a software testing using cloud computing, which means using resources found in the cloud. Resources may be any hardware, software, and infrastructure necessary to carry out the tests. Easy access to the cloud environment helps organizations approach software testing as an easily scalable, on-demand service. Over the last decades, traditional software testing incurs a high cost to simulate user activity from multiple locations. Most applications were running on client/server architecture, and data was tightly coupled with applications in client/server architecture. Then the World Wide Web came along with N-tier application architecture where developers could create flexible and reusable applicat...
